

INTERNAL BONE RECONSTRUCTION USING MACHINE LEARNING

Moira Shooter
Lucien Hugueniot

OVERVIEW

- Predicting the **porosity factor** (amount of void space) of a porous object such as a bone to **3D reconstruct** the internal structure of the object with help of **machine learning**
- **Can** the Machine learning algorithm **learn** the porosity of objects?

Machine learning technical terms

Epoch: An epoch is one **complete presentation** of the data set **to be learned** by the machine learning algorithm

ReLU: Stands for Rectified Linear Unit and is a non-linear operation. It **replaces** all **negative pixel values** in feature map **with zero**.

Convolutional layer : **Extracts features** such as edges **from the input image**, and creates feature maps, the more features extracted the better the network recognise images

Machine learning technical terms

Pooling Layer: Reduces the dimensionality of each feature map but keeps the most important information

Dense Layer(Fully connected layer): all the neurons from the previous layer with the current layer

Drop out layer: The purpose of this layer is to **avoid overfitting**

Motivation

Simulations

Realistic modeling of porous materials [2]

Engineering

Soil conditions and plant growth [3]

Motivation

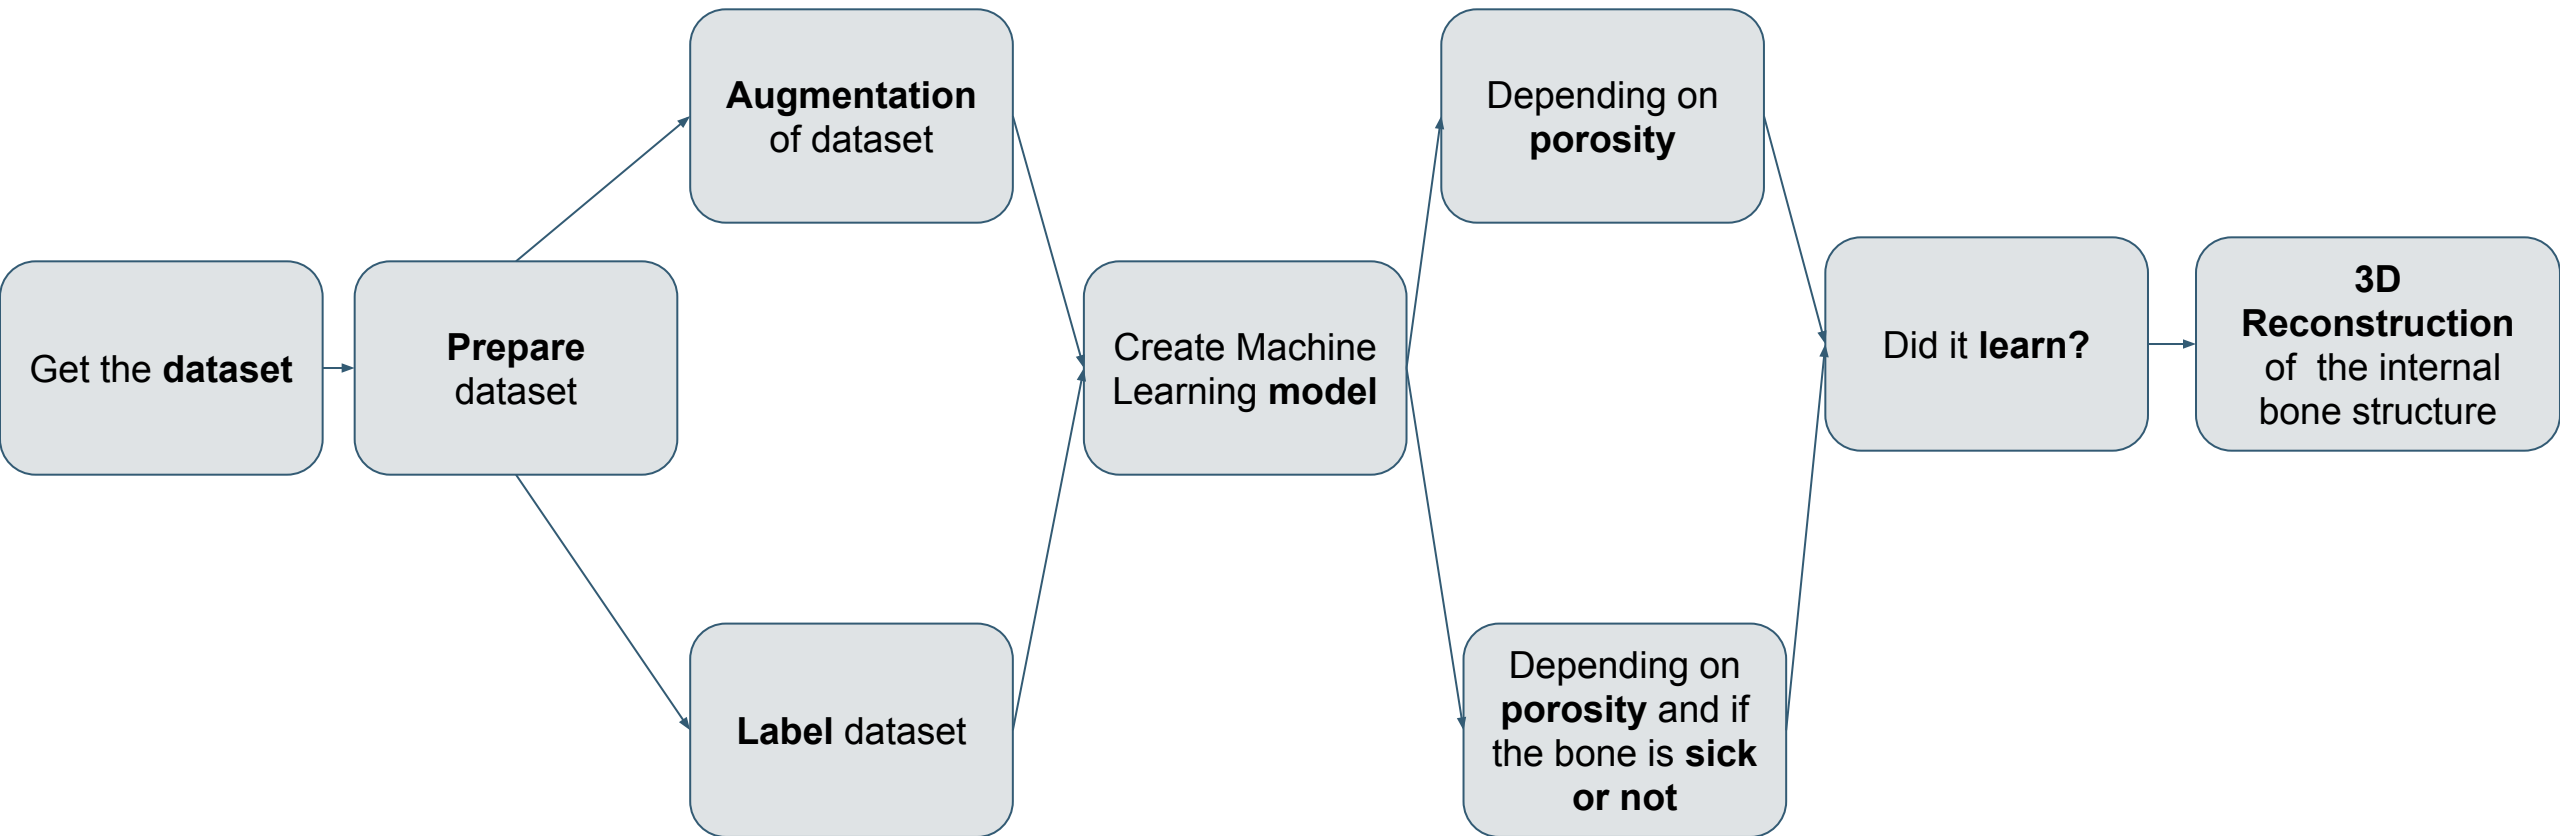

Medical area
Prosthetics [5]

Medical area
Analysing bone sickness[6]

APPROACH

PREPARE THE DATASET[1]

Depending on **healthiness factor** of the bone

Depending on **porosity factor** of the bone

THE BIGGER THE BETTER

Original Image

= 190,219 images

Iterations:
Flip vertically,
horizontally,
both,
Translate,
Brightness

THE BIGGER THE BETTER

Original Image

Iterations:
Rotation of
image to the
left

CALCULATING THE POROSITY

Original Image

Alpha Image Created
blur - threshold - contour - morph(closing)

Processed Image

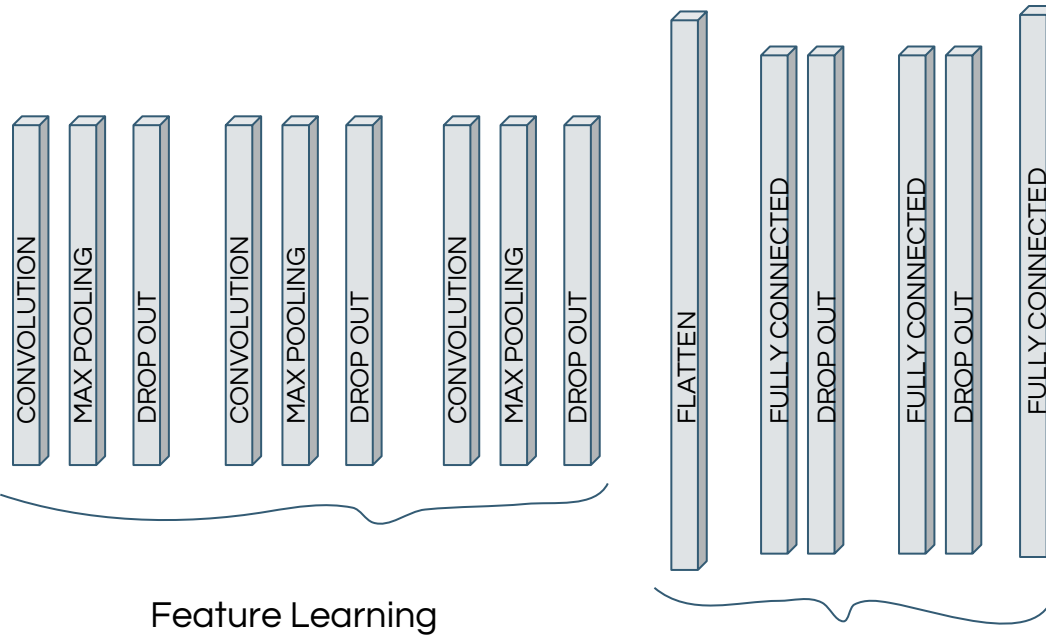

```
amount of white pixels: 110818  
amount of black pixels: 116290  
porosity: 51.0
```

MODEL CREATED WITH PARAMETERS

Depending on the **healthiness factor** [1*]

Input : 150 x 150 x 1

Layer (type)	Output Shape	Param #
conv2d (Conv2D)	(None, 146, 146, 64)	1664
max_pooling2d (MaxPooling2D)	(None, 73, 73, 64)	0
dropout (Dropout)	(None, 73, 73, 64)	0
conv2d_1 (Conv2D)	(None, 69, 69, 32)	51232
max_pooling2d_1 (MaxPooling2D)	(None, 34, 34, 32)	0
dropout_1 (Dropout)	(None, 34, 34, 32)	0
conv2d_2 (Conv2D)	(None, 30, 30, 32)	25632
max_pooling2d_2 (MaxPooling2D)	(None, 15, 15, 32)	0
dropout_2 (Dropout)	(None, 15, 15, 32)	0
flatten (Flatten)	(None, 7200)	0
dense (Dense)	(None, 80)	576080
dropout_3 (Dropout)	(None, 80)	0
dense_1 (Dense)	(None, 30)	2430
dropout_4 (Dropout)	(None, 30)	0
dense_2 (Dense)	(None, 2)	62

RESULTS

Training

Depending on health factor

Amount of epochs: **5**

Loss: **0.0558**

Accuracy: **97.98%**

Total time to train: **28.05 minutes**

Evaluation

Depending on health factor

Accuracy of
99.13%

Loss of
0.029

RESULTS

Training

Depending on porosity factor

Amount of epochs: **50**

Loss: **0.15**

Accuracy: **95%**

Total time to train: **26 min**

Evaluation

Depending on porosity factor

Accuracy of
95%

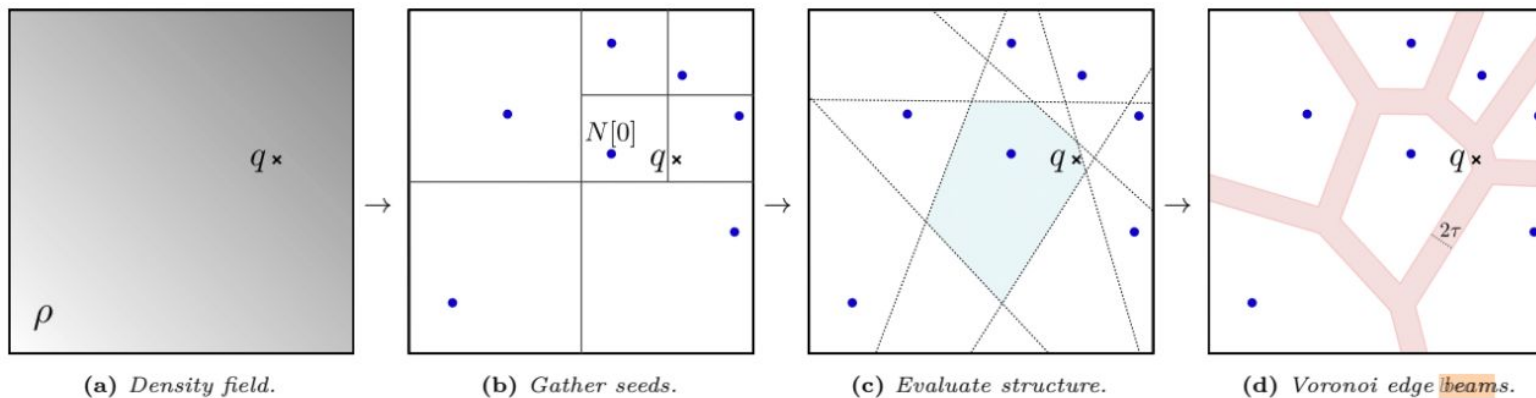

Loss of
0.15

Predictions

Future Work

- Reconstruct a 3D model based on the porosity factor [4]
 - Paper: Procedural voronoi foams for additive manufacturing (SIGGRAPH 2016)
 - This method depends on two parameters the density (porosity factor) and the radius of a beam (hole)
- 3D print the porous object

Q&A

Parameters

[1*]

Convolution	Amount of nodes = 64	kernel_size = 5	activation = 'relu'	input_shape = (150,150,1)
Max Pooling		pool_size = (2,2)		
Drop out	rate = 0.4			
Convolution	Amount of nodes = 32	kernel_size = 5	activation = 'relu'	
Max Pooling		pool_size = (2,2)		
Drop out	rate = 0.4			
Convolution	Amount of nodes = 32	kernel_size = 3	activation = 'relu'	
Max Pooling		pool_size(2,2)		
Drop out	rate = 0.5			
Flatten				
Dense	Amount of nodes = 80		activation = 'relu'	
Drop out	rate = 0.3			
Dense	Amount of nodes = 30		activation = 'relu'	
Drop out	rate = 0.5			
Dense	Amount of nodes = 2		activation = 'softmax'	

Parameters
